

Raspberry LCD Display Stand

Building Instructions.

Simple and easy to build stand for your Raspberry Pi LCD display. Have your display get the right angle with this solid and lightweight stand.

Version 1.0 Jan 2018

Raspberry Pi touchscreen stand.

This model are taken from an idea of Gerard Wassink from the Netherlands. He decided to make a frame for his Raspberry Pi 3 B with touchscreen. It was inconveniently laying on his desk, leaning on some awkward extenders; flimsy at best. He cut some Totem beams at the right lengths, mounted them together and built a 45 (-ish) degree frame so that it sits firmly on his desk now. He also made a variant with 2 extra legs, that made it possible to place the LCD/Raspberry in a vertical position, so that it can be put on a shelf at eyes height.

Gerard Wassink's website: <http://nerd.gerardwassink.nl>

Parts needed to build this model:

You will need to cut beams in the following lengths and quantity:

2x 7cm
2x 8cm
2x 11cm
2x 17cm

Cutting strategy:

Beam 1: 1x17cm , 2x8cm , 1x7cm

Beam 2: 1x17cm , 2x 11cm

Beam 3: 1x7cm

The cutoff will be 0cm in Beam1, 1cm in beam2 , and the 3rd beam will be 33cm after cut.

Beams needed : 2 beams if you can find a 7cm piece somewhere, otherwise 3 beams is needed.

Nut M3 6x10

Beams : 2 x 8cm

Optional step:
If you also prefer to place
your LCD/Raspberry in a
vertical position, add these
vertical beams.

Gerard used a standard Raspberry 7" touch-screen monitor. There are more types to be used together with a Raspberry. They may have different sizes and mounting. You will probably manage to modify this model to fit your particular type of monitor.

Store the legs used for vertical position like this when using the stand as a normal 45 degree stand.

If you are changing often between positions, you don't need to fasten the extra vertical legs with bolts and nuts. They will be sturdy enough.
